

Darwin and the Science of Evolution

Author: Patrick Tort

Publisher : Gallimard

Category : Science, Technology, Medicine

Genres : Physics/Chemistry/Biology

Keywords : Evolution - Theory - Identity - Museum - Elderly

A spotlight on the life and work of the primary founder of evolutionary science.

In the *Origin of Species*, Charles Darwin publicly set forth his theory that populations evolve over the course of generations through a process of natural selection. Species are not fixed, but vary and transform according to the law of the survival of the fittest. This was revolutionary: the idea of an almighty Creator crumbled, and with it any providential natural "plan." Victorian England grew vehemently impassioned, whether for or against. A scientific tale that sums up and explains Darwin's main theories as well as the impact of his ideas throughout the world.
